Research Interests

My research focuses on the application of formal methods to the analysis and optimization of computing systems, including software programs, VLSI circuits, and emerging technologies. Specifically, I am active in the following directions (tools which I developed or contributed to are given in parentheses):

- Development of new algorithms for software verification (CPACHECKER)
- Verification of sequential digital circuits with software techniques (BTOR2C)
- Stochastic Boolean satisfiability and its application to probabilistic systems (RESSAT and ERSSAT)
- Optimization and verification of threshold logic circuits (TLCOLLAPSEVERIFY)

The theoretical foundation of my work is algorithms and data structures, formal methods, mathematical logic, and system modeling. My goal is to invent new approaches and apply them to real-world challenges. I also emphasize software engineering for tool implementation and reproducible evaluation.
